

What is Metal Cladding?

Metal cladding comes in all shapes and size. Almost any steel or metal products can be used in a cladding or facade application.

Most Common Types of Metal Cladding

1.  Aluminum
2.  Copper
3.  Steel

It's a superior barrier against wind, hailstorms, driving rain, falling branches and flying debris.

Metal cladding is a balance of both function and aesthetic.

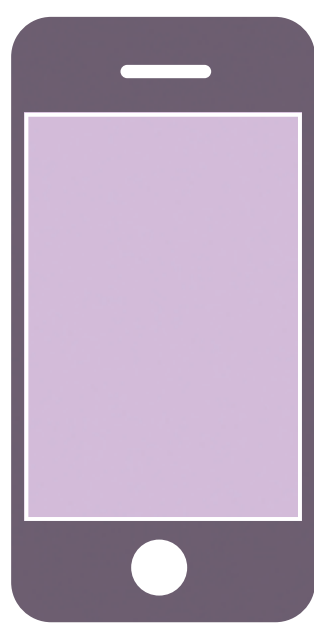

Because it's available in lightweight, continual-length sheets, it's fast and easy to erect — reducing construction time and keeping labor costs to a minimum.
